Understanding of road user behaviour in **E**urope

Identification of potential areas of application and research

An overview of WP1

Fridulv Sagberg, Institute of Transport Economics

1st PROLOGUE Workshop, Brussels, February 18th, 2010

Task 1.1

Experiences from ND related studies

- previous and current studies
- different methodologies (EDR, instrumented cars, "real ND")
- input from organisations (European and world-wide)

Task 1.2

Interests of user groups

- literature scan
- input from Advisory Board members
- communication with SHRP2 programme
- questionnaire to User Forum members

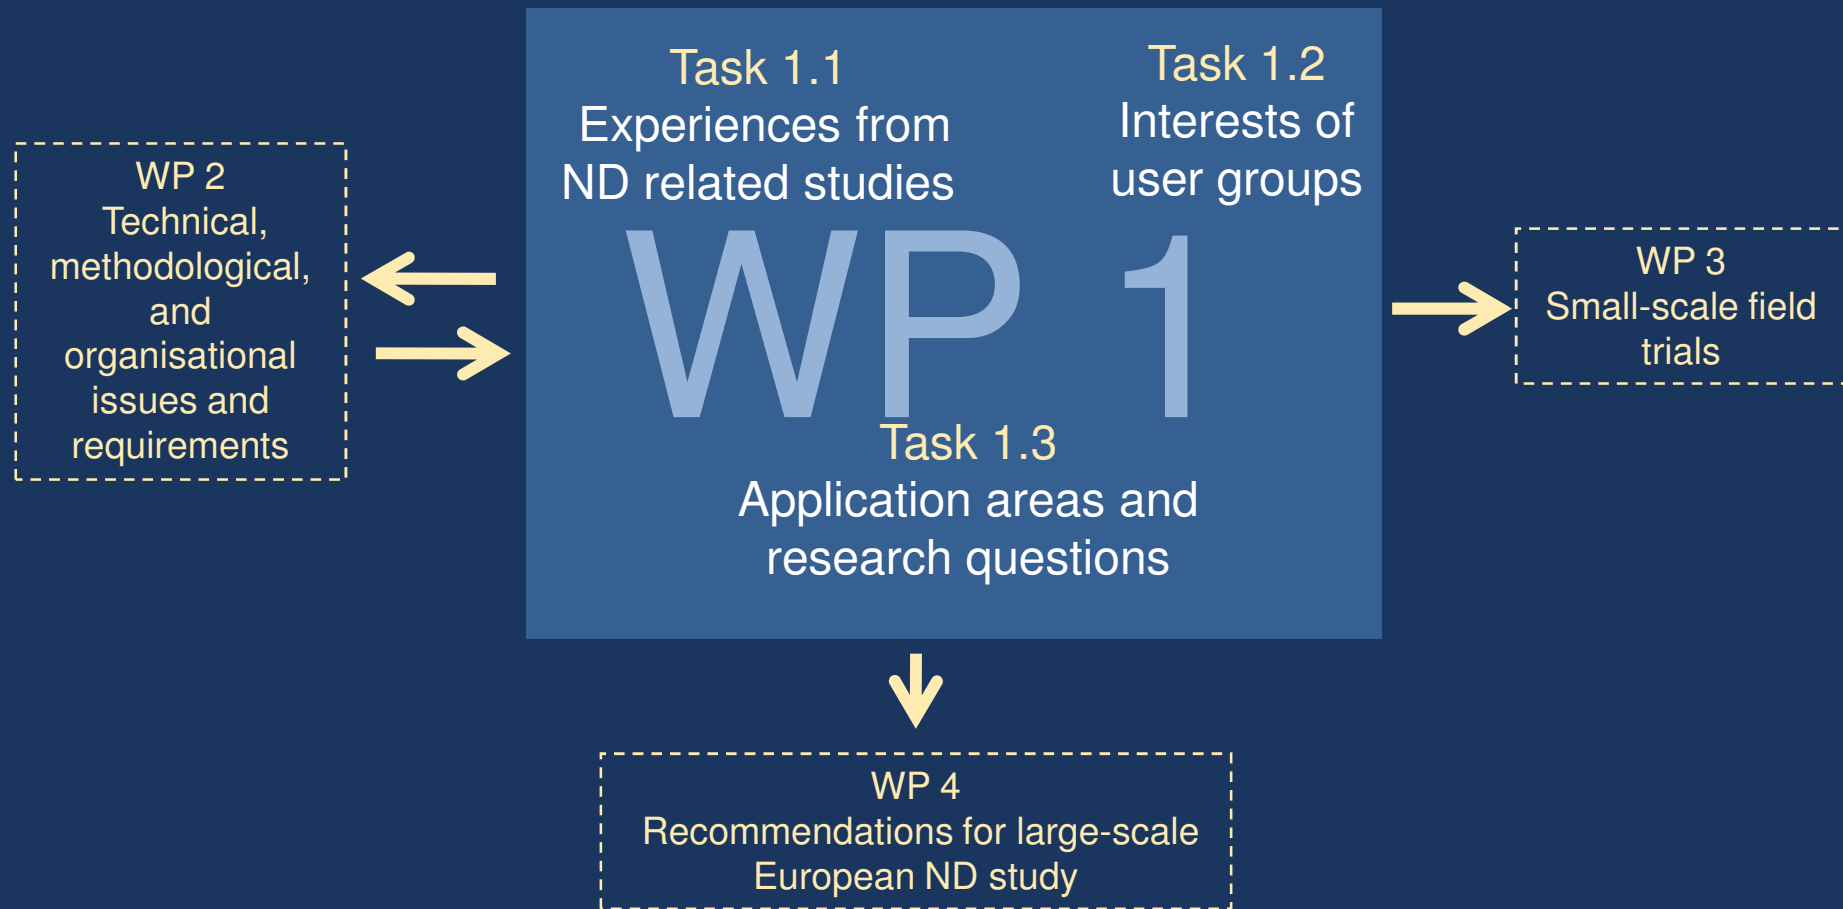

Task 1.3

Application areas and research questions

- actual and potential areas

WP 1

Relation to other WPs

Task 1.1 Previous and current research Findings

Main areas investigated with ND methods:

- Driver distraction and inattention
- Drowsiness and fatigue
- In-vehicle systems
- Lane change behaviour
- Heavy-vehicle – light-vehicle interaction
- Driver characteristics and states
- Applied use of naturalistic driving – e.g., in driver training and graduated driver licensing programs

Task 1.2 User interests

Survey among User Forum members

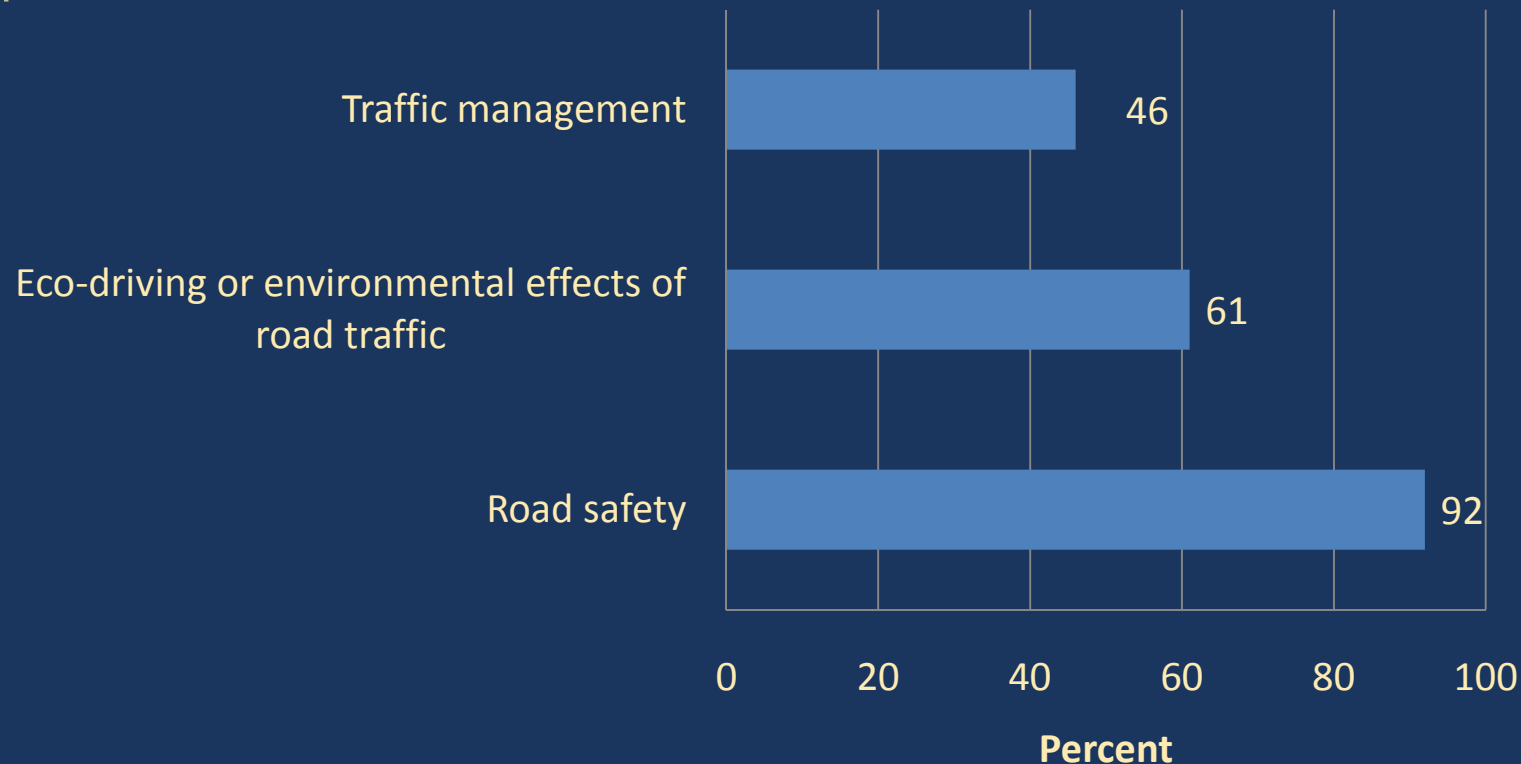

- About 150 persons received the questionnaire
- 72 persons responded
 - 18 countries
 - different types of organisations
 - government 10
 - industry 6
 - research 31
 - other 25

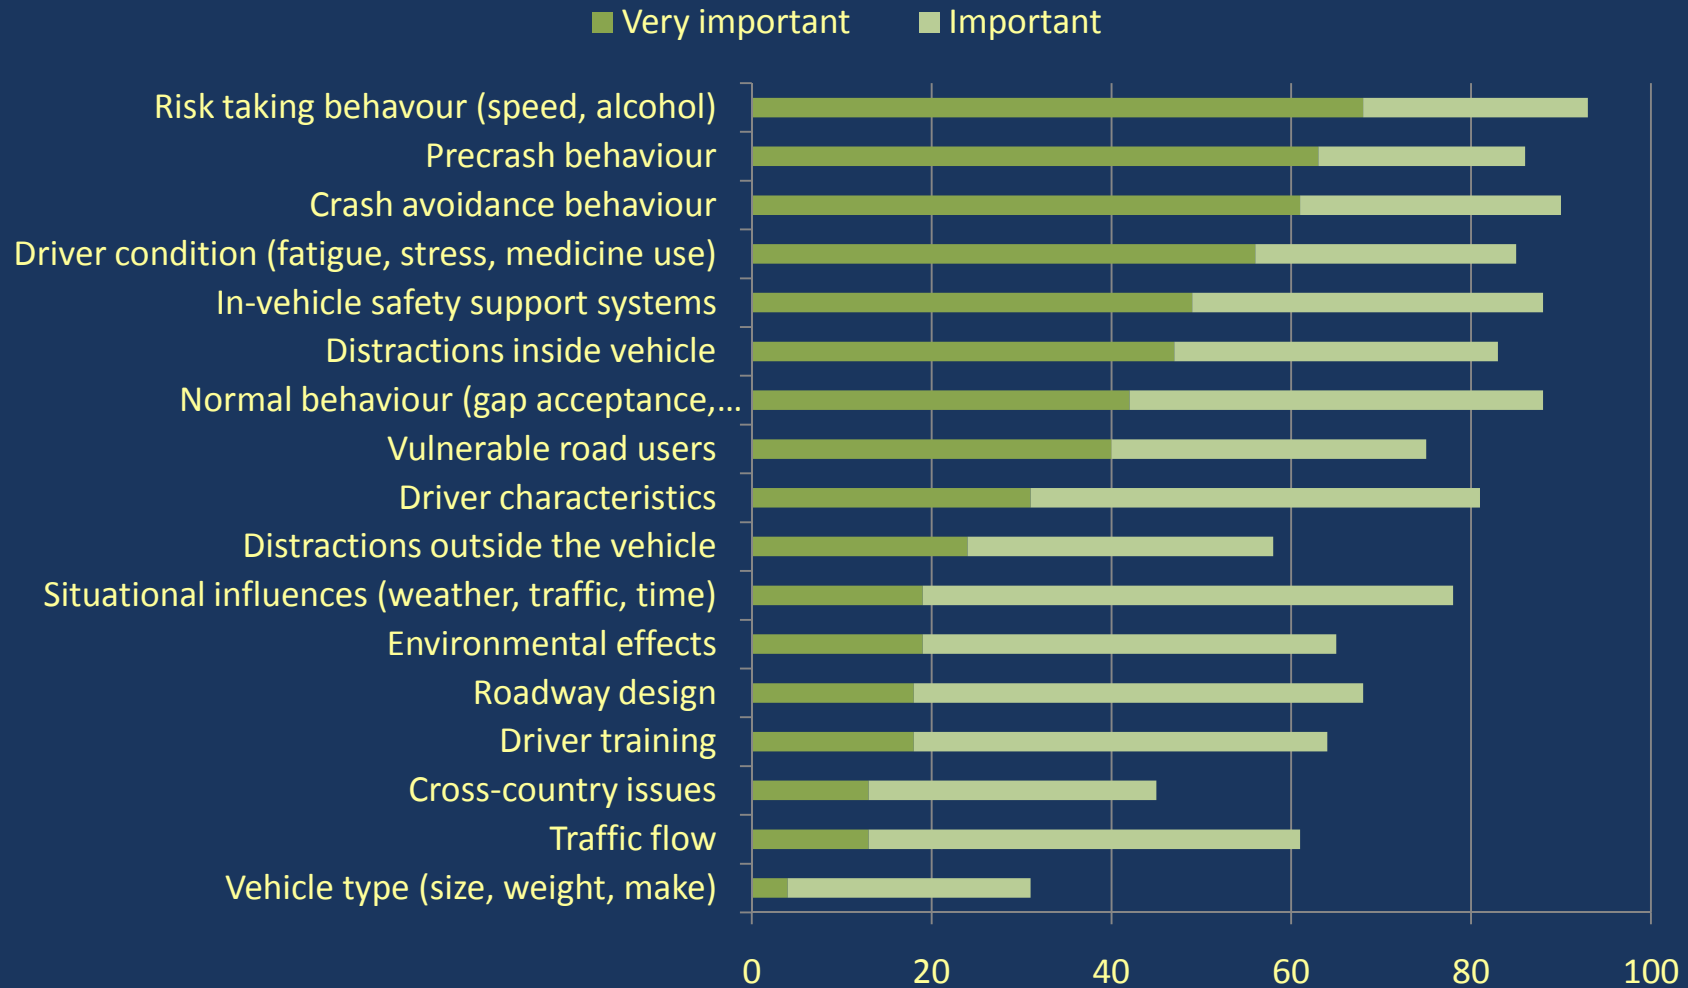

User survey: General areas of interest

”Which of the following areas would you consider to be interesting to investigate with the use of a large-scale European naturalistic driving experiment?”

User survey: Prioritized topics

User survey: Additional topics

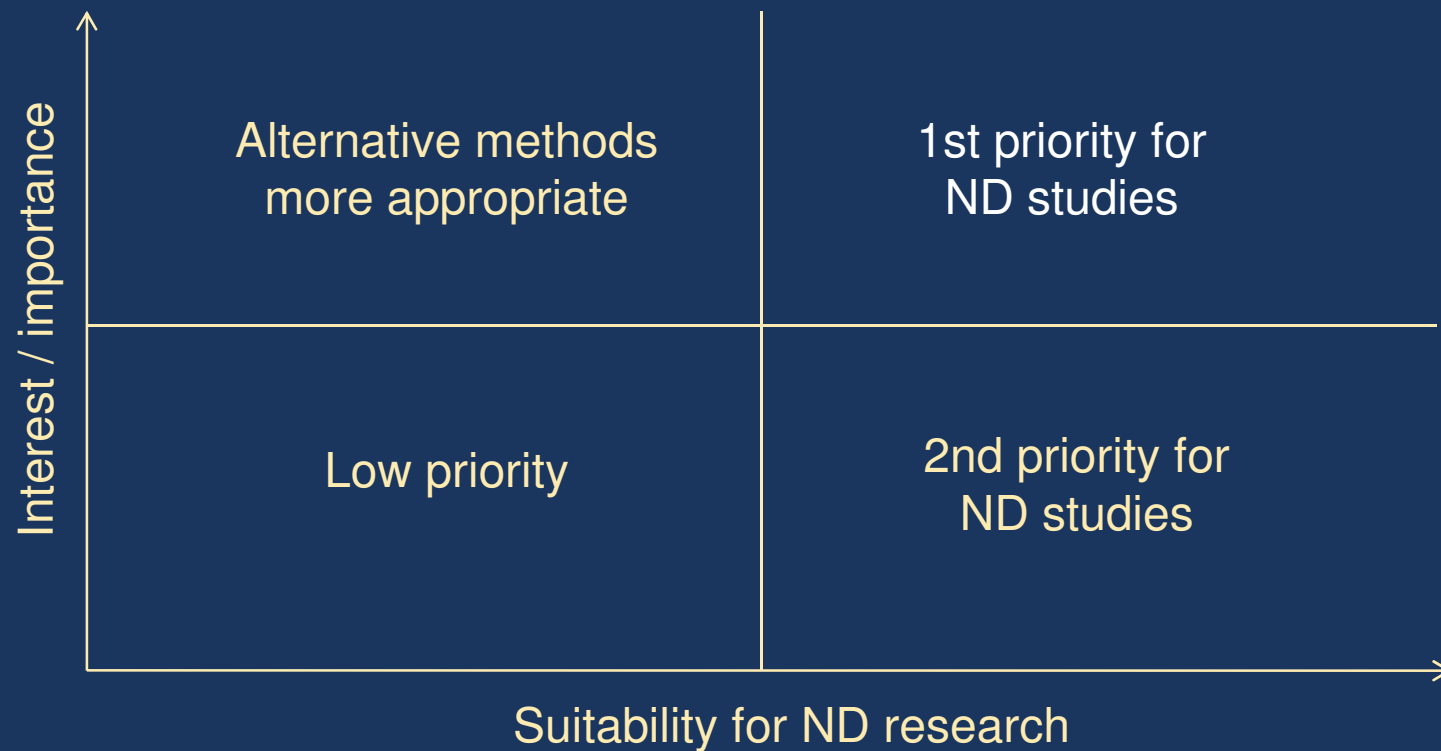

- Visual attention of drivers
- Low speed manoeuvres (parking etc.)
- Influence of new co-operative systems on driver behaviour
- eSafety effectiveness
- Distraction from children and other passengers
- Validity of performance indicators
- Definition of extreme driver behaviour groups (teen drivers), and passive methods to reduce their risk
- Effects of platooning
- CBA
- Car drivers' detection of and accommodation to MCs
- Speed changes as function of other vehicles' speed
- Collision partners of cars (e.g. vulnerable road users)
- Influence of parents on children's driving behaviour
- Information of information/education on driving style
- Feedback on driving by video
- Human errors and violations

Questions about research questions.....

- Interesting vs. less interesting ?
- Suitable vs less suitable for investigations by ND ?

Task 1.3 Framework for defining research topics and questions

- Dimension 1:
Categories of behaviour suitable for observation in ND studies
 - Which behavioural indicators can be observed?
- Dimension 2:
Situations/conditions
 - Under which conditions is observation of these behaviours relevant?
- Combining the two dimensions into a "Behaviour X Situation" matrix
- Each cell of the matrix indicates a global research topic
- Several specific research topics and questions can be specified in each cell

Behaviour categories

- Distraction and inattention
- Fatigue, sleepiness and other impairments
- Decision-making, errors, driving style/performance
- Lane change/position
- Speed and acceleration
- Gap acceptance
- Aggressive driving
- Learning

Situational categories (conditions)

- Driver background, trip characteristics
- Road system/environment, ambient conditions
- Vehicle design/equipment/condition
- Traffic volume/composition, other road users

Matrix – examples of research topics/questions

SITUATION BEHAVIOUR	Driver background, trip characteristics	Road system/ environment, ambient condtions	etc.
Distraction and inattention	Young drivers and engagement in distractive activities	Distraction under different environmental conditions	-----
Fatigue, sleepiness, other impairment	How often and under what circumstances do drivers drive while fatigued?	Is falling asleep while driving more likely on monotonous roads?	-----
Decision making, driving errors/ style/performance	What is the role of inattention in intersection errors/conflicts?	Are drivers less likely to pass with centreline rumble strips?	-----
etc.	-----	-----	-----

Matrix – a useful tool for specifying research questions for ND research?

- Keep simple
 - A limited number of categories is preferable
- Missing topics?
 - Can existing categories be expanded/redefined?
 - If "no", add new category

Non-safety related research topics

- Eco-driving, environmental effects
- Traffic management
- Can be included in present matrix

Non-research applications of ND

- Driver training
- Accident investigation?
- Promoting safe and or environmentally friendly driving
 - Feedback
 - Knowledge of being observed

Methodological research issues

- Validation of alternative methods, e.g. self-reports
- Validation of accident reconstruction methods
- Validity of ND method:
 - Do drivers modify their behaviour when driving an ND-equipped vehicle?
- What are the best surrogate measures for crashes?
 - An important objective is to get knowledge about crash causation, but crashes are rare
 - How to define near-crashes and incidents?
 - Are there differences in risk factors between near-crashes/incidents and real crashes?

Additional results from user survey

- Some difference between countries grouped by mortality rate:
 - High-mortality countries less interested in environmental effects, and in driver training
- Small differences between types of organisation
 - Tendency for governments to be more interested in traffic flow issues, environmental issues and vehicle characteristics
- Strong interest in contributing to large-scale European study
 - Participating: 82 %
 - Funding: 4 %
 - In kind funding: 10 %

Thank you for your attention!
